

Business Validation Summary

Date: 2026-08-29

Status: ☒ Business validation passed for the live production API

Objective

Validate that the live Cloud Run API returns a meaningful, retail-relevant answer using the correct service-account authentication flow before proceeding to Teams / Copilot integration.

Working validation flow

```
gcloud auth activate-service-account \  
  sa-tot-osa@corp-stro-salesinventory-prod.iam.gserviceaccount.com \  
  --key-file="/home/sduque/sa/shelf-analyst-sa.json"  
  
TOKEN=$(gcloud auth print-identity-token)  
  
curl -sS -X POST "$API_URL" \  
  -H "Content-Type: application/json" \  
  -H "Authorization: Bearer ${TOKEN}" \  
  --data '{"user_id":"debug-user","message":"Analiza la disponibilidad en  
góndola de Talca Colín hoy","session_id":null}'
```

Successful evidence

The live API returned a business answer with **status**: "ok" and a real **session_id**.

Observed metrics from the validated answer:

- SNSG: 95.16%
- Bodega: 0.67%
- Quiebre: 4.17%

The answer was operationally meaningful and included:

- interpretation of the trend over the last 7 days
- diagnosis of root causes
- recommended actions
- expected business impact

Conclusion

The production API is healthy for business validation, and the correct identity flow is the real requirement for these tests.

The earlier failures were not a deployment or logic failure; they were caused by wrong auth context or missing service-account activation.

Acceptance criteria for next phase

The next phase can begin only after confirming the following:

- live API returns `status: "ok"`
- answer contains an operationally valid diagnosis
- answer includes concrete metrics or store-level reasoning
- session continuation works across follow-up prompts
- prompt variation produces coherent but non-repetitive answers

Next phase

Proceed to the Teams / Copilot integration layer only after the above business validation is accepted.

Immediate next implementation steps

1. Freeze the API contract as the stable backend interface.
2. Validate a small set of production-style prompts:
 - store diagnosis
 - recommendation request
 - comparison with nearby store
 - follow-up in same session
3. Prepare the Copilot Studio custom connector against the validated API.
4. Keep the existing Cloud Run API as the source of truth for business logic.
5. Track telemetry and answer quality before enterprise rollout.
